

Trade: Living on the fast lane

Executive Summary:

- The large trade surplus (USD 2.19 Bn) and export numbers (USD 18.48 Bn) in April is the result of an ongoing commodity boom.
- Like the post-GFC boom, the current boom is the product of US and China policies, but the timeline appears to be accelerated.
- The recent pullback of commodity prices suggests an ever-present fear of tapering in the global market, although we think that significant tightening in US policy would probably only happen in 2022.
- Strong imports, particularly of consumer goods, hint at strong domestic demand recovery, although it is not fully clear if the momentum would be carried as strongly into H2-21.
- While the CA deficit will likely widen, a severe macro adjustment (and hasty exit from the current fiscal/monetary policies a la 2013-15) need not necessarily befall Indonesia.

- Indonesia recorded a hefty trade surplus of USD 2.19 Bn for April, far larger than the consensus figure of USD 1.2 Bn. More remarkable than this miss, however, was the total trade value in either direction, which managed to sustain the already-strong momentum from March. Exports in particular had never reached such dizzying heights since 2011 (**Chart 1**).
- And just like in 2011, this export performance has been buoyed largely by a commodity boom. While it is true that Indonesian manufacturers have staged quite a turnaround from the dark early days of the pandemic – exports of machinery and electrical parts, for example, has grown at double-digit rates YTD – the recovery there has been dwarfed by that in the commodity sector.
- The drivers of the current commodity boom also look similar from the one we saw 10-11 years ago: manufacturing and construction booms in China and loose monetary as well as fiscal policies in the US in the aftermath of a major crisis. This web of ingredients took some time to unravel, giving commodity exporters like Indonesia considerable time to adjust.
- US fiscal policy went down first in 2011, following Republican victory in midterm elections and the ensuing debt ceiling showdown. Then the crack widened as the Fed announced its exit (tapering) from QE in mid-2013. But the big blow to commodities only happened in 2014, when the Chinese economic slowdown became apparent – as the then-new Xi administration cracked down on systemic risks in the country's opaque financial system.
- **The current boom seems like a re-run, but at a much faster pace.** China's growth rate returned to pre-Covid levels by Q4-20, and since then the authorities have spent time trying to cool down the economy, in order to stem the rise of Yuan and (lately) commodity prices. Meanwhile, fears of rampant inflation have re-ignited speculations about tapering, despite the Fed's own dovish assessments that the inflationary pressures are only temporary.
- All these explain the recent "tug of war" in commodity prices, whereby strong increases in March and April are followed by a pullback in May (**Chart 3**). We do think that tapering fears are somewhat premature at this point, and that one final leg of the stool (US fiscal policy) will remain at least until the 2022 midterms. But it is quite probable that the trade numbers in March and April represented the high watermark of the current recovery (or something close to that), and that the huge trade surplus would be gradually eroded.
- One indication is the stubbornly strong import numbers, despite a slowdown in oil/gas imports in April. **While part of it (i.e. raw materials) could be driven by export demands, the robust consumer goods imports suggest a strong domestic demand recovery (Chart 2).** It is not completely certain if this recovery would continue at its current pace beyond Q2 – or even beyond the Ramadan/Lebaran season – given the possibility of a resurgence in Covid-19 cases, but this is one further data point in support of our prediction that the CA deficit would widen significantly.

- The accelerated timeline of global policies, coupled with the widening of the CA deficit and the uncertainties regarding Covid cases and vaccination, is a risky mix that could – in the worst scenario – force a sharp adjustment on Indonesia, similar to what happened in 2013-15. At this point, however, we still think that our baseline scenario of a (mostly) orderly “off-ramp” from

the current situation is the likelier one. This is thanks to a combination of domestic factors, such as prudent macro management and the relative decline in foreign ownership of Indonesian bonds, as well as external factors such as the IMF’s planned allocation of SDRs for emerging markets.

Chart 1. Exports in March-April reached levels unseen since 2011

Chart 2. Import growth suggests robust demand recovery all-around

Chart 3. After a strong surge in March-April, commodity prices and global trade indicators began to decline in May
